5/1/23   feasible-catch notes

last week I got the dfs joined.

Next would be a comparison, FS by FS, so
   looking for a faceted plot.
   One could build a dashboard but not atm.
→ From the facets...

   1) any weirdness is often in the tails. Is
      this artefact of sorting?
      how would this affect, for example,
      the outcome of using a) %ile scores or
      b) a zscore calculation?
      AJR suggested zscore might be less
         sensitive to tails than %ile
      Does that mean green light or is
         zscore distorting fs dist.?

   2) seaborn includes all possible facets &
      there doesn't appear to be a
      straightforward way to drop
      empty facets. which.. ugh.
